WHAT ARE HORMONES?

Hormones are chemical messengers produced by the endocrine glands in the body. They travel through the bloodstream to various tissues and organs, where they regulate and coordinate a wide range of bodily functions.

HORMONAL IMBALANCES:

Hormonal imbalances occur when there is an excess or deficiency of certain hormones in the body. These imbalances can result in a wide range of symptoms and health issues that may significantly impact a woman's quality of life. **Some common hormonal imbalances in women include:**

01

PCOS

Polycystic Ovary Syndrome (PCOS): A hormonal disorder characterized by enlarged ovaries with small cysts, irregular periods, acne, and excessive hair growth.

02

PMS

Premenstrual Syndrome (PMS): A group of symptoms experienced by some women before menstruation, including mood swings, bloating, breast tenderness, and fatigue.

03

THYROID DISORDERS

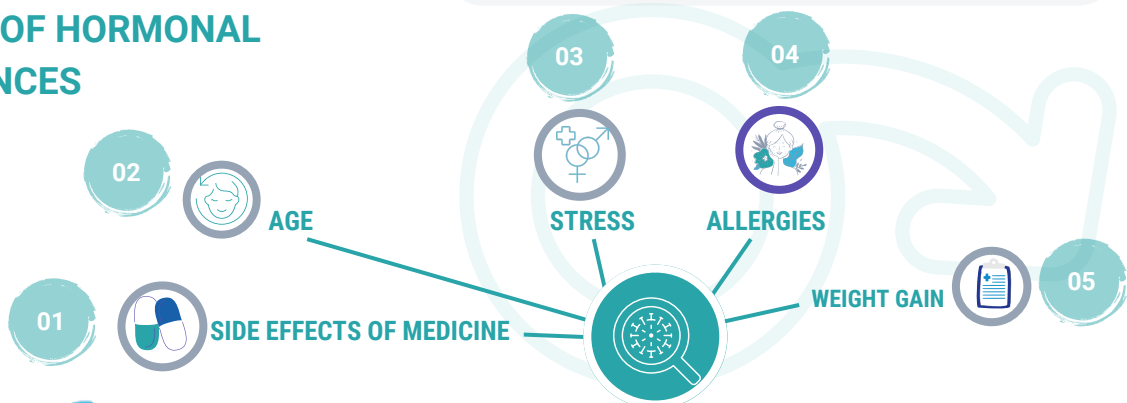

Conditions such as: Hypothyroidism (Underactive Thyroid) or Hyperthyroidism (Overactive Thyroid), can disrupt hormone production, leading to various symptoms like weight changes, fatigue and mood disturbances.

04

MENOPAUSE

During this natural transition, a woman's hormone levels, particularly estrogen and progesterone, decrease, causing symptoms such as hot flashes, night sweats, and mood swings.

CAUSES OF HORMONAL IMBALANCES

THE IMPORTANCE OF HORMONES:

Hormones play a vital role in regulating numerous bodily functions and maintaining overall well-being.

Hormones play a crucial role in controlling **growth, metabolism, reproduction, mood, sleep, and other physiological processes**. They act as signals, transmitting instructions from one part of the body to another, ensuring that different systems work together harmoniously. **In women, hormones such as estrogen, progesterone, and testosterone** influence reproductive health, mood, metabolism, bone density, and much more. These chemical messengers are produced by various endocrine glands, including the ovaries, thyroid, and adrenal glands.

DIFFERENT SIGNS AND SYMBOLS TO TRACK HORMONAL IMBALANCE

One can track hormonal imbalance through symbols or signs that your body shows. Some of these signals are:

Fluctuation in the level of oestrogen can cause headaches.

A drop in the level of oestrogen can cause excessive sweating or hot flashes.
